

1.) Slash Commands

Slash commands are commands that begin with a forward slash (/). They provide a quick way to perform specific actions without navigating through menus or typing long instructions.

Think of them like **keyboard shortcuts in text form**.

For example, instead of clicking buttons to create a new file, invite someone, or assign a task, you simply type a command that starts with /.

2.) Why slash commands are used ?

They are used to:

- Perform actions quickly
- Save time
- Reduce mouse clicks
- Access features that might be hidden in menus
- Automate repetitive tasks

3.)Where are the slash commands used?

They are very common used in:

- Chat applications
- AI assistants
- Developer tools
- Games
- Project management software
- Command-line tools
- Version control systems
- Team collaboration apps

Examples

User types:

/weather Mumbai

↓

Recognize "/" at the beginning

↓

Identify the command:

weather

↓

Extract the argument:

Mumbai

↓

Run the weather function

↓

Display:

"Today's temperature in Mumbai is 30°C."

Few examples of /slash commands:

/explain

/fix

/review

/summarize

/retest

/rerun

/rebuild

/retry

/deploy staging
